Update V2 for XBase09

the XBase09 gets a new feature: a three track midi sequencer to make its known live performance fully advanced!

Midi Track Mode:

being selected through the ramp page mode, one can edit up to three midi voices with note on events and different note lengths via several knobs in a very simple logic. Samplers, synths or drum expanders can be played without further equipment just by the XBase09.

The three instruments areas BD, SD and HH have a second function in the midi track mode and form the three midi voices. The note ons can be easily programmed via steps set and erase like in the internal drum sequencer. Midi channel, key number, octave and note length are programmed by the individual instrument knobs.

Each pattern in version 2.xx has automatically 3 midi tracks plus. Other pattern data remains unaltered!

Because you can edit a key number for each step individually, you can play a melody line just with one track. Furthermore, you can program three voice polyphonic chords or three different sounds or further drum tracks, whatever you want because each track can have its own channel.

Bugs have been fixed. The sometimes bothering flickering of values at some machines is hardware related, but has been minimized through software. The overall performance of timing and midi has been highly improved. Inadvertently erase of steps of neighbored patterns is fixed and the scaling and rescaling of A/B patterns is better now.

Volume controllers are now sent and received by the Xbase.

100 additional factory rom presets are contained in the new ROM area of the performance kits. They can be edited and copied to the users ram kits.

Further improvements, especially in the midi modes are still under work
